

Abstract

In order to provide a procedure and a device that will enable the, at least partially, automated acceptance of bank notes that can be realized in an acceptable cost range and that will enable the highly automated, rapid acceptance of bank notes with a high level of certainty, a method, in which a test for the acceptability of bank notes is performed by automatic vending machines is proposed; by this method a bank note is fed via a transport unit to a digitalization station, where it is at least partially digitized; the data obtained in this manner are then compared with stored data by a computer unit, which makes a determination of value, and renders an automatic decision regarding acceptance. If the automatic decision regarding acceptance is negative, an image of the digitized data is generated in order to allow a service employee to perform a visual inspection of the note and render a final decision regarding acceptance.
